EmpathyMap –ImportDatausing Transform Maps

User / Person: A beginner ServiceNow administrator (HR data admin) who receives bulk employee data in Excel format and must migrate it into ServiceNow accurately using Import Sets and Transform Maps.

Think & Feel	**Hear**
• "Will every spreadsheet column land in the correct ServiceNow field?" • "What if the same file is imported twice – will duplicate employees appear?" • Worried about breaking data integrity in the employee table • Unsure how the Import Set table differs from the target table • Wants confidence that the import is accurate and repeatable	• Manager: "Bulk employee data will arrive in Excel format." • Team lead: "Don't type records manually – use Import Sets." • Senior developer: "Coalesce on a unique field like Employee ID." • HR team: "We need clean, up-to-date employee records." • Peers: "Always validate the data after the transform runs."
See	**Say & Do**
• Spreadsheet with Employee ID, Name, Email, Department, Location • Import Set staging table holding the raw uploaded rows • Transform Map screen mapping source fields to target fields • Transform History with Inserted / Updated / Ignored counts • Many navigation menus (Load Data, Transform Maps, Tables)	• Prepares a sample spreadsheet and downloads it as .xlsx • Loads the file through System Import Sets → Load Data • Creates a Transform Map and uses Auto Map Matching Fields • Runs the transform and checks the records in the target table • Says: "Let me re-import and confirm no duplicates are created."

Pain	Gain
• Manual data entry is slow and error-prone • Duplicate records appear when the same data is imported again • Wrong field mapping gives empty or incorrect values • Multi-step import process is hard for beginners to follow • No quick way to see what was inserted, updated or skipped	• Fast, automated bulk loading of employee data • Clean data with no duplicates (Coalesce on Employee ID) • Easy verification through Transform History • Reusable Transform Map for future imports • Confidence and accuracy in the migrated data
