Ideation Phase
Define the Problem Statements

Date	29 September 2026
Team ID	9100Spark
Project Name	Import Data using Transform Maps
Maximum Marks	2 Marks

Project context: This micro project imports structured employee data from an external Excel spreadsheet into ServiceNow. The data is loaded into an Import Set (staging) table, mapped to the target table using a Transform Map, transformed, and then validated for accuracy and data integrity.

Customer Problem Statements (project-specific):

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	A beginner ServiceNow administrator	Import bulk employee data from an Excel spreadsheet into ServiceNow	Entering or moving the records manually is slow and fields get mapped incorrectly	The data must pass through an Import Set staging table and a Transform Map that I am not yet familiar with	Anxious and unsure about the accuracy of the imported data
PS-2	An HR data owner	Re-import updated employee data whenever the source spreadsheet changes	The same import creates duplicate employee records	No unique key (Coalesce on Employee ID) is defined in the Transform Map	Frustrated and unable to trust the employee data
PS-3	An HR manager / administrator	Verify the result of each import and understand employee distribution	I cannot easily tell what was inserted, updated, ignored or which department has how many employees	Results are only visible in raw tables and Transform History, with no consolidated view	Uncertain about decisions and dependent on manual analysis

Problem Statement Summary:

Organizations often receive employee data as Excel files and need to load it into ServiceNow in bulk. Doing this by hand is slow and error-prone, and beginners struggle to understand how loading data, field mapping, transformation and verification fit together. Without validation and a unique key, repeated imports can also create duplicate or incorrect records.

Goal: provide a clear, end-to-end import process that loads spreadsheet data into an Import Set table, maps it to the target table with a Transform Map, executes the transform, and validates the results so that the data is accurate, consistent and free of duplicates.
